

## Tiling Path File (TPF) Specification v1.1

**What it is:** A TPF specifies the order of a set of sequences along a larger molecule(s). Gap types and sizes can be specified. The molecule can be as large as a chromosome and as small as a sequence contig made up of one smaller sequence. A TPF can have one or more sequences/clones.

**What it is not:** A TPF does not specify the particular version of a sequence, nor does it specify the switch points between adjacent clones in a given scaffold/contig.

**Header Information:** Header information is provided in a key-value type of structure. Each header field will be prefixed with ##. These fields are available:

- ✚ ##Organism (Required)
- ✚ ##Assembly Name (Required)
- ✚ ##Chromosome (Required)
- ✚ ##Strain/Haplotype/Cultivar (Optional)
- ✚ ##Type (controlled vocabulary) (Required)
- ✚ ##Version (Calculated by Database, Required)
- ✚ ##Comment (Optional)

Additional information will be calculated at submission.

- ✚ ##Submitter
- ✚ ##Create date
- ✚ ##Update date

Here is an example header:

```
##ORGANISM: Mus musculus
##ASSEMBLY NAME: Reference
##CHROMOSOME: 1
##STRAIN/HAPLOTYPE/CULTIVAR: C57BL/6J
##TYPE: Complete Chromosome
##Version: 1
##Comment: some useful information here.
##SUBMITTER: Tina Graves, WUGSC
##CREATE DATE: Nov 3 2006 12:16PM
##UPDATE DATE: Nov 5 2006 12:12PM
```

The data defining the actual tiling path should be flanked in header and footer lines to minimize the chance of file truncation. The header and footer lines shall have the following format:

All header "## TAG: value" pairs must occur before this line:

##==== Beginning of TPF Data ====

Required after the TPF data rows:

##==== End of TPF Data ====

#### **Column definitions for sequence lines:**

**Column 1:** accession number. This must be a valid accession assigned by the International DNA Sequence Database (GenBank/EMBL/DDBJ). No version number is required and a supplied version will be ignored. It is assumed that the current version of the accession is what is intended. **OPTIONAL**, use "?" if unknown.

**Column 2:** clone name. If the sequence is defined by a clone, then the clone name should be specified here. Ideally, standard Clone Registry nomenclature will be used. If a sequence is derived from more than one clone, the clone name can be given as "MULTIPLE". **OPTIONAL**, use "?" if unknown.

**Column 3:** local contig identifier. Name given to the scaffold/contig generated by assembling the listed sequences. **REQUIRED**

**Column 4:** contained. This line is only used to specify clones that are known to be contained within another clone on the TPF. The only value allowed is 'contained'. **OPTIONAL**

**Column 5:** accession number. This must be a valid accession assigned by the INSDC. No version number is required and a supplied version will be ignored. It is assumed that the current version of the accession is what is intended. The accession provided in this column must be in column 1 on another line. See below for requirements. **REQUIRED if COLUMN 4 is included, otherwise not valid.**

**Column 6:** clone name. If the sequence is defined by a clone, then the clone name should be specified here. Ideally, standard Clone Registry nomenclature will be used. See below for requirements. **REQUIRED IF COLUMN 4 is included, otherwise not valid.**

NOTE1: Columns 5 and 6- these are similar to columns 1 and 2 in that at least one but not both requires a value, but if both are known, please supply both values.

NOTE2: If column 4 has no value, do not include the "?" for any of columns 4, 5 or 6. If column 4 is populated, then provide values or "?" for columns 5 and 6.

#### **Column definitions for non-sequence lines:**

**Column 1:** GAP. This is the term used and it should always be capitalized.

Used to note the gap lines. **REQUIRED**

**Column 2:** gap type. Specifies the type of gap. **REQUIRED**

Values are:

- TYPE-1: [Deprecated]- was a place-holder for a picked clone.

- TYPE-2: clone gap
- TYPE-3: contig gap- unable to close using available technology
- Biological Gap: If there is a biological gap such as a centromere, etc. then use the name rather than type-4. This is a controlled vocabulary:
  - ⊖ CENTROMERE
  - ⊖ TELOMERE
  - ⊖ HETEROCHROMATIN
  - ⊖ SHORT-ARM

**Column 3:** Gap size. Estimated size of gap. In the absence of submitted gap sizes a default of 50,000 bp will be used for clone and contig gaps.

**OPTIONAL**, unless the gap type is 'Biological' then required.

**Column 4:** Method used to determine gap size. If a gap size has been estimated experimentally, the method should be noted here. Currently acceptable values:

- FISH
- OPTICAL MAP
- ALIGNMENT

Multiple methods may be entered for a single gap. Methods should be separated by a semi-colon (Example: FISH;OPTICAL MAP;ALIGNMENT).

**REQUIRED if column 3 is populated and gap type is not biological, otherwise not valid.**

All columns are tab delimited and lines are terminated by a newline. Lines beginning with a single "#" can occur anywhere within the file, are comments and can be ignored by parsers. Lines beginning with "##" can be ignored by simple parsers but contain structured information about the TPF.

Each file should have only one header, so all of the objects described in a file should have common header information.

### **Validation:**

For sequence based lines:

- If column 1 is populated with a valid accession, column 2 may be unpopulated (using "?" as a placeholder). Ideally, this will only occur in the case where a sequence is not based on a defined clone and will have no other easily identified name.
- If an accession is supplied it must be valid according to the IDNSC.
- If column 1 is not populated (using "?" as a placeholder) then column 2 should be populated.
- If there is not enough information to populate column 1 or 2, then a gap line should be used.
- If column 4 is populated, then columns 5 and 6 must be populated.
- If column 4 is not populated, then columns 5 and 6 must not be populated.

- ⊕ If a clone is contained, it should be listed immediately before or after (i.e.: adjacent to) the containing clone, or adjacent to other contained clones within the containing clone.
- ⊕ The contained clone can come before or after the clone in which it is contained.

For gap lines:

- ⊕ Gap type-1 lines will be allowed, but are not encouraged. There can be adjacent type-1 gap lines. Size will default to 50 Kb if no data provided. This gap type may be deprecated in future versions.
- ⊕ Gap type-2 lines will default to 50Kb if no other data is provided. There can be two adjacent type-2 gap lines.
- ⊕ Gap type-3 should not be adjacent. Size will default to 50 Kb if no data is provided.
- ⊕ Biological Gaps must provide a size estimate, they do not need to define a method.
- ⊕ TYPE-3 gaps may not be contained within a contig
- ⊕ BIOLOGICAL gaps may not be contained within a contig
- ⊕ There can be consecutive gap lines of different types.
- ⊕ If a gap size is provided in column 3, the method used to determine this size must be provided in column 4, unless column 2 is a biological gap.

### Specific examples:

1. A TPF may contain one or more partial contigs. For example:

```
##ORGANISM: Mus musculus
##CHROMOSOME: 1
##ASSEMBLY NAME: NOD
##STRAIN/HAPLOTYPE/CULTIVAR: NOD
##TYPE: Contig
##VERSION: 1
##COMMENT: Test TPF
##SUBMITTER: Schneider, NCBI
##CREATE DATE: Nov 3 2006 12:16PM
##UPDATE DATE: Nov 3 2006 12:16PM

#### Beginning of TPF Data ===

AL645951      DN-29B18      NCBI_Mmchr1_ctg163199
AL596283      DN-257N2      NCBI_Mmchr1_ctg163199
CR936839       CH29-120A16    NCBI_Mmchr1_ctg37199
CR936842       CH29-189K17    NCBI_Mmchr1_ctg37199
AL671997       DN-396O20     NCBI_Mmchr1_ctg163206
AL672024       DN-378G17     NCBI_Mmchr1_ctg163206

#### End of TPF Data ===
```

The absence of gap lines implies there is no known order for these contigs.

2. A TPF may specify an entire chromosome. For example:

```
##ORGANISM: Mus musculus
##CHROMOSOME: 2
##ASSEMBLY NAME: Reference
##STRAIN/HAPLOTYPE/CULTIVAR: C57BL/6J
##TYPE: Complete Chromosome
##VERSION: 2
##COMMENT: EXAMPLE TPF ONLY
##SUBMITTER: Schneider, NCBI
